

Репозиторий на GitHub: <https://github.com/pashokitsme/net-tech-2s>

Этот репозиторий, как и этот отчёт - второй этап braim.org/network-contest

Изначально оформлено в .md и предполагалось к просмотру в README репозитория.

В ходе выполнения использовался пакетный (проектный) менеджер uv. Поэтому для вызова команд используется uv run <command>.

В качестве машин использовались три docker-контейнера с базовым образом alt linux, а также установленным openssh и подготовленными ключами.

Контроллер доменов не был реализован (соответственно, и ввод клиентов в него)

TL;DR

||| uv заменить на необходимый пакетный менеджер

```
git clone https://github.com/pashokitsme/net-tech-2s
cd net-tech-2s

docker compose up -d
uv run ansible-playbook -i inventory.yaml playbooks/install.yaml
```

Особенности реализации из-за docker-контейнеров

- 1 Всё, что связано с systemd - не работает, поскольку сам systemd не инициализируется в контейнерах. Из-за этого в плейбуке не используется ansible.builtin.service для управления сервисами, процессы убиваются и запускаются вручную
- 2 Традиционно (bridge/host) сети) контейнеры запускаются с заранее заданным ip. Поэтому для работы dhcp-сервера была использована сеть macvlan. Кроме неё, используется bridge для доступа к контейнерам с хост машины по сети - иначе бы пришлось настраивать macvlan и на хосте тоже
- 3 В docker compose версии v2.34.0-desktop.1 не работает опция gw_priority (<https://github.com/docker/compose/issues/12574>), поэтому нужный интерфейс ищется по-месту - иногда он может быть eth0, а иногда eth1

Окружение

Dockerfile

Предполагается, что на целевой машине уже установлен SSH-сервер и указаны ключи для доступа

```
FROM alt:latest

RUN apt-get update
RUN apt-get install -y openssh-server

RUN ssh-keygen -A

RUN sed -i 's/#PermitRootLogin prohibit-password/PermitRootLogin yes/' /etc/openssh/sshd_config \
&& \
    sed -i 's/#PubkeyAuthentication/PubkeyAuthentication/' /etc/openssh/sshd_config && \
    printf 'AuthorizedKeysFile %s\n' /root/.ssh/authorized_keys >> /etc/openssh/sshd_config

CMD ["/usr/sbin/sshd", "-D"]
```

docker compose

Разворачивает минимальное окружение, в котором будет происходить выполнение playbook

```

- net-internal
- net-external

services:
  srv01:
    build: .
    container_name: srv01
    hostname: srv01
    volumes:

client02:
  ansible_port: 6003
  ansible_ssh_private_key_file: ./keys/client02

```

Playbook

В этой главе освещены не все задачи этого плейбука, а лишь главное.

Полностью его посмотреть можно в [репозитории](#).

Установка Python

Изначально ни на одной машине нет Python. Следовательно, Ansible не сможет полноценно выполнять функции. Этот Play выводит версию Python и устанавливает в случае его отсутствия.

```

- name: Install python
  hosts: all
  become: true
  gather_facts: false
  vars:
    python_version: 3
    executable: /bin/bash

  pre_tasks:
    - name: Check if python is installed
      ansible.builtin.raw: python{{ python_version }} --version
      args:
        executable: '{{ executable }}'
      register: python_installed
      failed_when: false
      changed_when: false

    - name: Update package repository
      ansible.builtin.raw: apt-get update
      args:
        executable: '{{ executable }}'
        when: 'python_installed.rc'
        changed_when: 'python_installed.rc'

    - name: Install python{{ python_version }}
      ansible.builtin.raw: apt-get install -y python{{ python_version }}
      args:
        executable: '{{ executable }}'
        when: 'python_installed.rc'
        changed_when: 'python_installed.rc'

  tasks:
    - name: Gather installed python version
      ansible.builtin.raw: python{{ python_version }} --version
      args:
        executable: '{{ executable }}'
      register: result
      changed_when: false

    - name: Display python version
      ansible.builtin.debug:
        msg: '{{ result.stdout.strip() }}'

```

Установка web-сервера

Используется Angie – идейный форк Nginx, поскольку он разрабатывается российскими разработчиками (что требовала задача – российский софт).

Устанавливается только если не был уже установлен. После этого тестируется конфиг, запускается и отправляется http запрос на порт 80 для проверки.

```

- name: Setup web-server
  hosts: servers
  become: true
  gather_facts: false

```

```

tasks:
  - name: Check if Angie is installed
    ansible.builtin.command:
      cmd: angie -v
    register: angie_installed
    failed_when: false
    changed_when: false

  - name: Download Angie keys & add repository
    ansible.builtin.shell:
      cmd: # (... сокращено, скрипт с доки)
    when: angie_installed.rc
    changed_when: angie_installed.rc

  - name: Install packages
    ansible.builtin.package:
      name:
        - angie
      update_cache: true
      state: present_not_latest
    when: angie_installed.rc

  - name: Test Angie conf
    ansible.builtin.command:
      cmd: angie -t
    register: angie_conf
    changed_when: false

  - name: Stop Angie
    ansible.builtin.shell:
      cmd: |
        if [ -f /run/angie.pid ]; then
          angie -s stop
          exit 0
        fi
        exit 1
    register: angie_stop
    when: angie_conf.rc == 0
    changed_when: angie_stop.rc == 0
    failed_when: angie_stop.rc > 1

  - name: Start Angie
    ansible.builtin.command:
      cmd: angie
    when: angie_conf.rc == 0
    changed_when: angie_conf.rc == 0

  - name: Test Angie
    ansible.builtin.uri:
      url: http://localhost:80
      method: GET
    changed_when: false

```

DHCP-сервер

Устанавливается дефолтный dhcp-сервер из пакетного реестра alt linux. Конфиг берётся из

`playbooks/templates/dhcpd.conf`

```

authoritative;
default-lease-time 600;
max-lease-time 7200;

subnet 10.10.0.0 netmask 255.255.255.0 {
  range 10.10.0.110 10.10.0.120;
  option routers 10.10.0.1;
  option domain-name-servers 10.10.0.2;
  option domain-name "internal";
}

```

```

- name: Install DHCP server
  hosts: servers
  gather_facts: false

  tasks:
    - name: Install DHCP server
      ansible.builtin.package:
        name:
          - dhcp-server

```

```

- dhcp-client
  state: present_not_latest

- name: Stop DHCP server
  ansible.builtin.command:
    cmd: pkill -F /run/dhcpd.pid
  register: dhcpd_stop
  failed_when: dhcpd_stop.rc > 1
  changed_when: dhcpd_stop.rc == 0

- name: Configure DHCP server
  ansible.builtin.template:
    src: dhcpd.conf
    dest: /etc/dhcp/dhcpd.conf
    owner: root
    group: root
    mode: '0640'

- name: Test DHCP server conf
  ansible.builtin.command:
    cmd: dhcpcd -t
  become: true
  register: dhcpd_conf
  changed_when: false

- name: Start DHCP server
  ansible.builtin.command:
    cmd: dhcpcd
  when: dhcpd_conf.rc == 0
  changed_when: dhcpd_conf.rc == 0

- name: Assign static IP to server
  ansible.builtin.shell:
    cmd: |
      set -o pipefail
      INTERFACE=$(ip -o addr show | awk '/10.10.0.*brd 10.10.0.255/{print $2}')
      ip addr flush dev $INTERFACE
      ip addr add 10.10.0.2/24 dev $INTERFACE
      ip link set $INTERFACE up
    async: 1
    poll: 0
    changed_when: true

```

DHCP-клиент

```

- name: Install DHCP client
  hosts: clients
  gather_facts: false
  tasks:
    - name: Install DHCP client
      ansible.builtin.package:
        name:
          - dhcp-client
        state: present_not_latest

    - name: Retrieve interface name
      # (...сокращено)

    - name: Set interface fact
      # (...сокращено)

      # selected_interface = eth0 или eth1

    - name: Display interface
      ansible.builtin.debug:
        msg: 'Selected interface: {{ selected_interface }}'

    - name: 'Release addresses: {{ selected_interface }}'
      ansible.builtin.shell:
        cmd: |
          set -o pipefail
          dhclient -r {{ selected_interface }}
          ip addr flush dev {{ selected_interface }}
      changed_when: true

    - name: Run DHCP client
      ansible.builtin.command:
        cmd: dhclient {{ selected_interface }}
      changed_when: true

    - name: Gather claimed IP addresses

```

```

ansible.builtin.shell:
  cmd: |
    set -o pipefail
    ip -br -f inet addr show {{ selected_interface }} | awk '{print $3}'
  register: claimed_addresses
  changed_when: false

  - name: Display claimed addresses
    ansible.builtin.debug:
      msg: 'Claimed addresses: {{ claimed_addresses.stdout.strip() }}'

```

DNS-сервер

В качестве dns-сервера используется bind.

Файлы с зонами, конфигурациями и так далее всё так же расположены в `playbooks/templates/`.

Зона .internal – db.internal

```

$TTL 86400
@ IN SOA ns.internal. admin.internal. (
  2023040101 ; Serial
  3600        ; Refresh
  1800        ; Retry
  604800      ; Expire
  86400 )     ; Minimum TTL

; Name servers
@ IN NS ns.internal.

; A records
@ IN A 10.10.0.2
ns IN A 10.10.0.2
server IN CNAME ns.internal.

```

Реверс-зона db.10.10.rev

```

$TTL 86400
@ IN SOA ns.internal. admin.internal. (
  2023040101 ; Serial
  3600        ; Refresh
  1800        ; Retry
  604800      ; Expire
  86400 )     ; Minimum TTL

; Name servers
@ IN NS ns.internal.

; PTR records
2.0 IN PTR ns.internal.

```

named.conf

```

options {
  directory "/etc/bind";
  allow-query { any; };
  forwarders { 1.1.1.1; };
  recursion yes;
  dnssec-validation no;
};

zone "internal" {
  type master;
  file "/etc/bind/zones/db.internal";
  allow-transfer { none; };
};

zone "10.10.in-addr.arpa" {
  type master;
  file "/etc/bind/zones/db.10.10.rev";
  allow-transfer { none; };
};

```

resolv.conf

Для клиентов устанавливается следующий `resolv.conf`

```
nameserver 10.10.0.2
```

Play

```
# Сервер
- name: Install DNS server
  hosts: servers
  gather_facts: false

  tasks:
    - name: Install DNS server
      ansible.builtin.package:
        name:
          - bind
        state: present_not_latest

    - name: Create bind user
      ansible.builtin.user:
        name: bind
        state: present

    - name: Create bind directories
      ansible.builtin.file:
        path: '{{ item }}'
        state: directory
        owner: root
        group: bind
        mode: '0750'
      loop:
        - /etc/bind
        - /etc/bind/zones

    - name: Configure DNS server
      ansible.builtin.template:
        src: '{{ item.from }}'
        dest: '{{ item.to }}'
        owner: root
        group: bind
        mode: '0750'
      loop:
        - from: named.conf
          to: /etc/bind/named.conf
        - from: db.internal
          to: /etc/bind/zones/db.internal
        - from: db.10.10.rev
          to: /etc/bind/zones/db.10.10.rev

    - name: Test DNS server conf
      ansible.builtin.command:
        cmd: named-checkconf /etc/bind/named.conf
      register: named_conf
      changed_when: false

    - name: Start DNS server
      ansible.builtin.command:
        cmd: named
      register: named_start
      when: named_conf.rc == 0
      changed_when: named_conf.rc == 0
      failed_when: named_start.rc != 0

# Клиенты
- name: Configure DNS client
  hosts: clients
  gather_facts: false

  tasks:
    - name: Copy resolv.conf
      ansible.builtin.template:
        src: resolv.conf
        dest: /tmp/resolv.conf
        owner: root
        group: root
        mode: '0640'

    - name: Configure resolv.conf
```

```

ansible.builtin.shell:
  cmd: |
    set -o pipefail
    cat /tmp/resolv.conf > /etc/resolv.conf
    rm /tmp/resolv.conf
  changed_when: true

- name: Test DNS server
  hosts: clients
  gather_facts: false

  tasks:
    - name: Test DNS server
      ansible.builtin.command:
        cmd: nslookup {{ item.host }} {{ item.dns }}
      loop:
        - host: ya.ru
          dns: 8.8.8.8
        - host: server.internal
          dns: 10.10.0.2
        - host: server.internal
          dns: ''
      changed_when: false
      register: nslookup_result

    - name: Display nslookup result
      ansible.builtin.debug:
        msg: "{{ nslookup_result.results | map(attribute='stdout') | list }}"

```

По результатам установки проводится тестирование: клиенты должны иметь возможность получить ip-адрес сервера по доменному имени `server.internal`

Межсетевой экран

Следующая конфигурация iptables разрешает только некоторый трафик. Сконфигурирован под работу с AD, но AD не был реализован.

Конфигурация

```

net-tech-2s  master * 58s
> -
```

В ходе выполнения playbook, он автоматически проверяет работу DNS сервера и выводит назначенные ip. Такие ip он назначил:

```
net-tech-2s master *?
> docker exec -it srv01 ip -o addr show
1: lo    inet 127.0.0.1/8 scope host lo\      valid_lft forever preferred_lft forever
1: lo    inet6 ::1/128 scope host \      valid_lft forever preferred_lft forever
11: eth1    inet 10.100.0.4/24 brd 10.100.0.255 scope global eth1\      valid_lft forever preferred_lft forever
57: eth0    inet 10.10.0.3/24 brd 10.10.0.255 scope global eth0\      valid_lft forever preferred_lft forever
58: eth0    inet 10.10.0.2/24 scope global secondary eth0\      valid_lft forever preferred_lft forever

net-tech-2s master *?
> docker exec -it client01 ip -o addr show
1: lo    inet 127.0.0.1/8 scope host lo\      valid_lft forever preferred_lft forever
1: lo    inet6 ::1/128 scope host \      valid_lft forever preferred_lft forever
11: eth0    inet 10.100.0.2/24 brd 10.100.0.255 scope global eth0\      valid_lft forever preferred_lft forever
58: eth1    inet 10.10.0.11/24 brd 10.10.0.255 scope global eth1\      valid_lft forever preferred_lft forever

net-tech-2s master *?
>
```

Проверка доступности HTTP-сервера по доменному имени при помощи curl:

```
net-tech-2s master *?
> docker exec -it client01 curl -so /dev/null -w "HTTP: %{http_code}\n" http://server.internal
HTTP: 200

net-tech-2s master *?
> docker exec -it client02 curl -so /dev/null -w "HTTP: %{http_code}\n" http://server.internal
HTTP: 200

net-tech-2s master *?
> docker exec -it srv01 curl -so /dev/null -w "HTTP: %{http_code}\n" http://localhost
HTTP: 200

net-tech-2s master *?
>
```
